Are **temperate** Marine Protected Areas Effective Tools for Sustainable Fisheries Management ?

Systematic Review 23
Centre for Evidence-Based Conservation
www.cebc.bangor.ac.uk

The CEBC Goal: making environmental management more effective

- Focus on supporting decision-makers in policy and practice
- What works and what doesn't in the context of interventions?
- What are the likely impacts of new policy developments?
- **What are the knowledge gaps/research priorities?**

THE COCHRANE COLLABORATION

The reliable source of evidence in healthcare

Upcoming CEE review groups

- Invasive species control
- Species re-introductions
- Impacts of aquaculture
- Biodiversity and ecosystem services
- Environment and public health
- Management of small populations
- **Marine biodiversity conservation**

Methodological development: Stages of a systematic review

- Formulating a question (stakeholder engagement)
- Generating a protocol (peer reviewed)
- Systematic searching
- Data selection
- Data quality assessment (critical appraisal)
- Data extraction
- Synthesis of data (meta-analysis)
- Implications

Guidelines now published as Pullin & Stewart 2006. *Conserv. Biol.*

Roberts, P.D., Stewart, G.B. & Pullin, A.S. (2006) Are review articles a reliable source of evidence to support conservation and environmental management? A comparison with medicine. *Biological Conservation* 132, 409-423.

DCA ordination of the three different classes of review.

SR 23 - Review Team

Are Marine Protected Areas Effective Tools for Sustainable Fisheries Management ?

1 – temperate zone areas

Stewart, G.B., Côté, I.M., Kaiser, M.J., Halpern, B., Lester, S., Bayliss, H.R., Mengersson, K., & Pullin, A.S.

Draft available online in a week or so

Inclusion Criteria

- **Relevant subject(s):** All temperate marine taxa (with subgroups of conservation and/or commercial concern).
- **Types of intervention:** Implementation of fishing restrictions within MPA defined as geographically defined areas subject to fishing prohibition (no take).
- **Types of outcome:** Changes in abundance (density, biomass or species richness measures).

Review Statistics - Scope

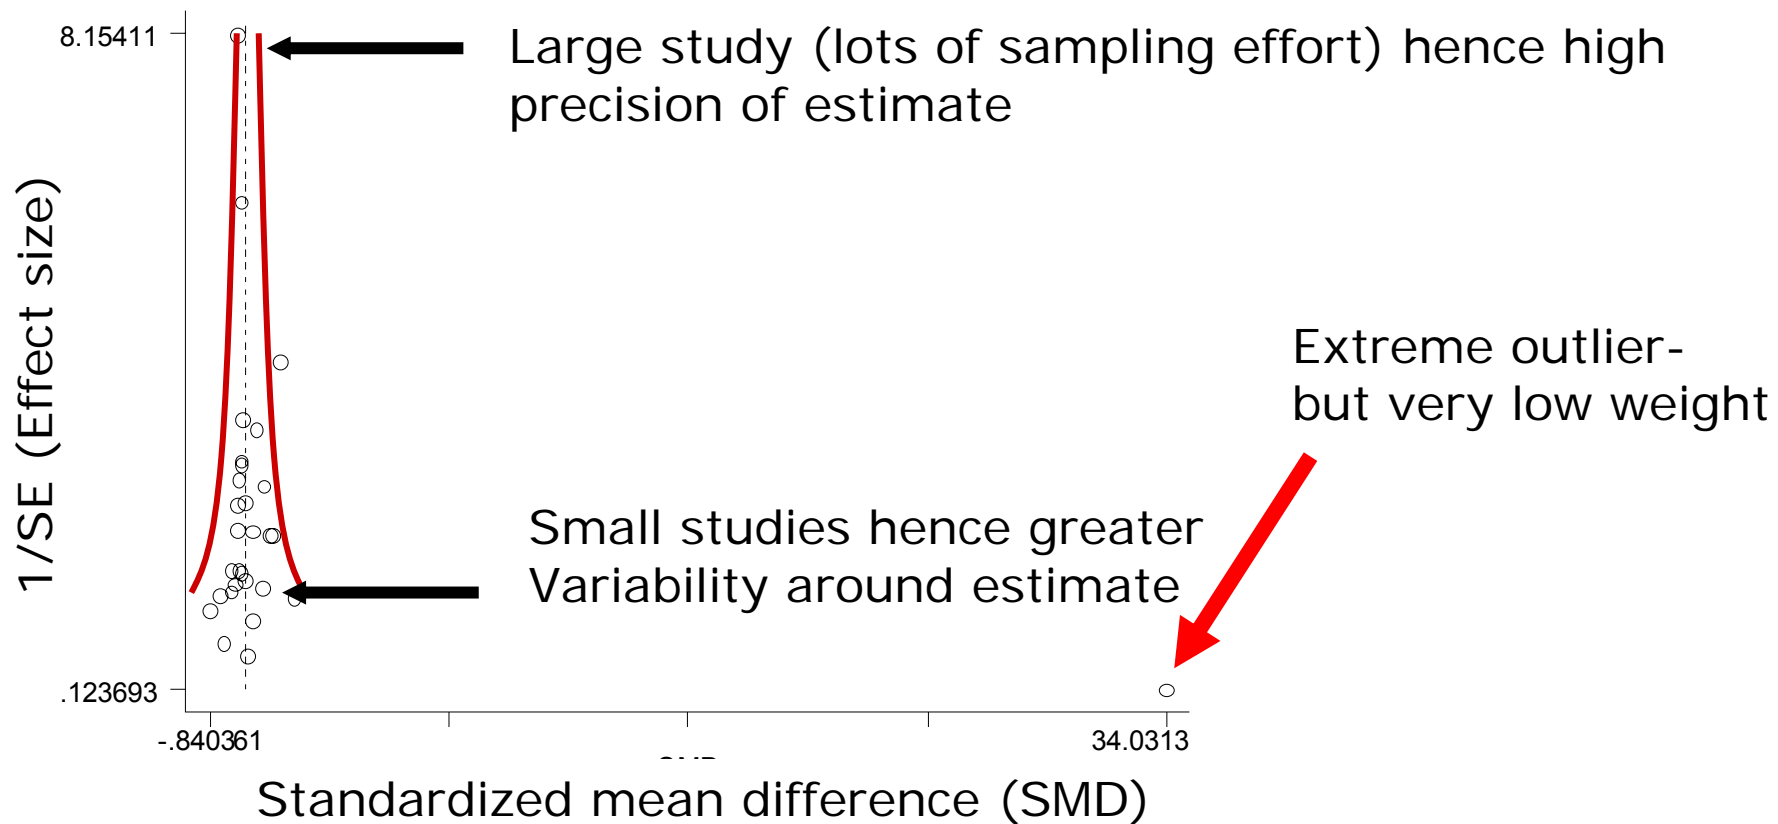

- Search identified 3531 articles
- 34 studies on temperate MPAs provided data with a valid comparator
- Reporting on 30 independent MPAs
- year of establishment (1963 – 1998)
- size (0.01 – 300km²)
- Depth (3 – 230m)
- number of taxa (1-202)

Review Statistics - Quality

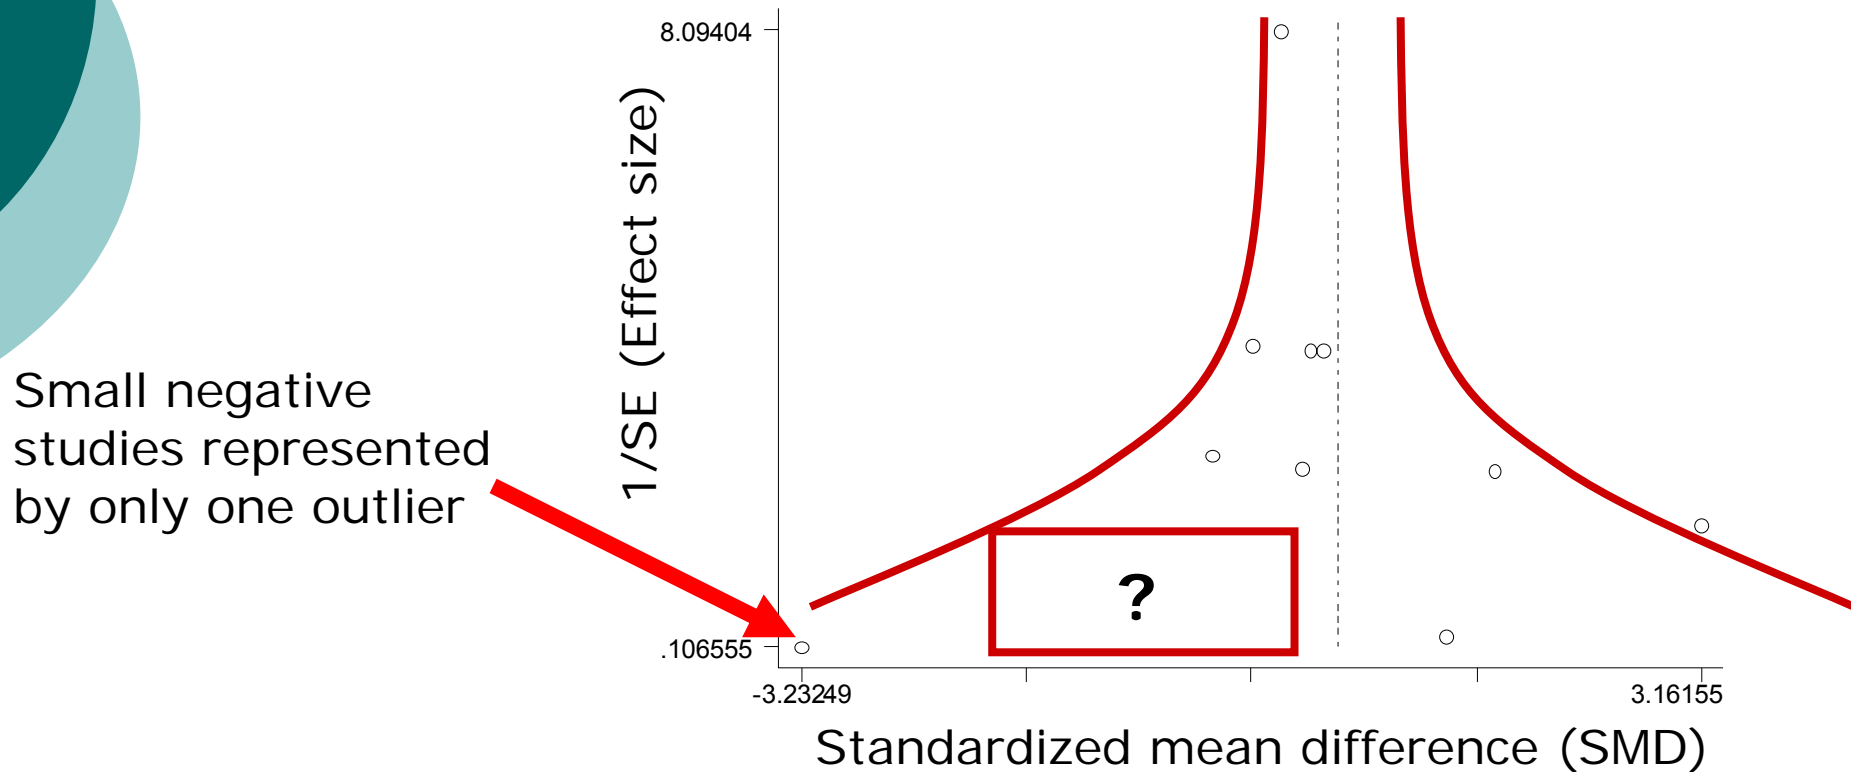

- 31/34 studies were pseudo-replicated
- Original data extracted from each study and disaggregated as far as possible.
- Data synthesised using random effects meta-analysis based on standardised mean difference (Hedges d) and log response ratios

Density: pooled at reserve level

90% density-R maybe overestimate but 40% density-S is robust- at least a 40% difference in density is therefore conservative at reserve level

Biomass – pooled at reserve level

> 100% difference in biomass therefore probably an overestimate but a biologically significant difference exists

To summarise

Within MPAs the following increases are observed:

- Density by at least 40%
- Biomass (>100%) but associated with some uncertainty
- Species richness of between 27 - 68%

Fish Density – overall increase 57%

No significant differences in species level effects for:

Life-mode
(benthopelagic, pelagic etc.)

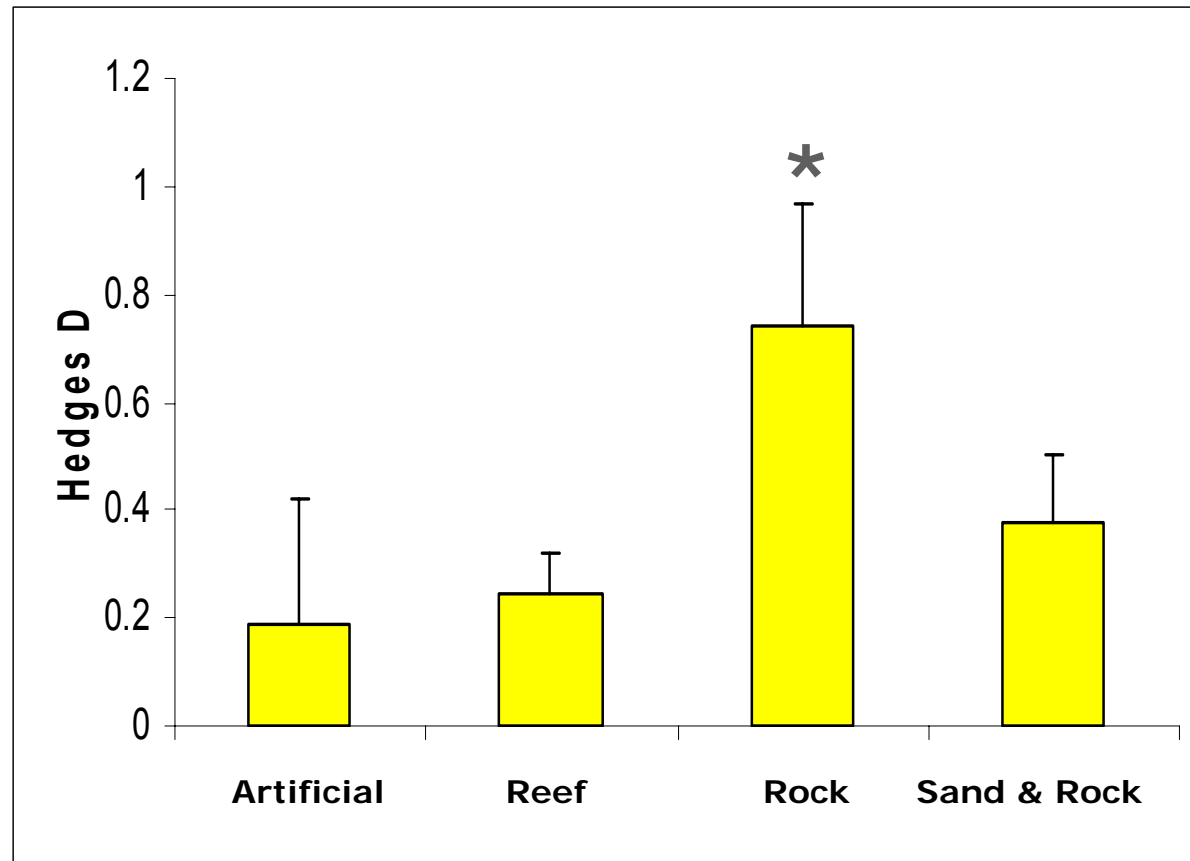

Utility (subsistence, commercial)

Mobility (migratory/non-migratory)

Life-history
(resilience/size)

But

Strong habitat effect

Species - reserve level interactions

Fish have a density effect size of 0.3

Invertebrates and algae have small non-significant effects when species within a reserve are pooled

Scandola
Tawharanui Marine Park
Te Whanganui a Hei (Hahei)
Torre Guaceto Marine Reserve
Tsitsikamma
Overall (95% CI)

Taxonomic variation

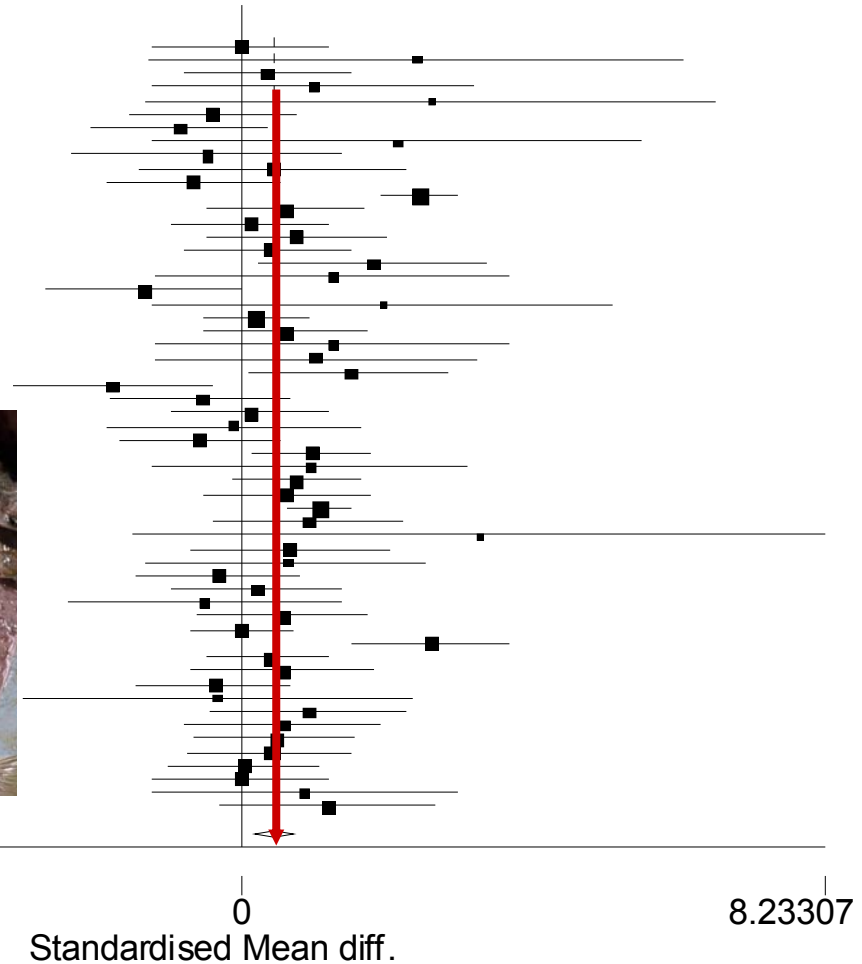

Pooling fish species within genera results in an increased effect size equating to an 86% difference in density

Power analysis – setting objectives

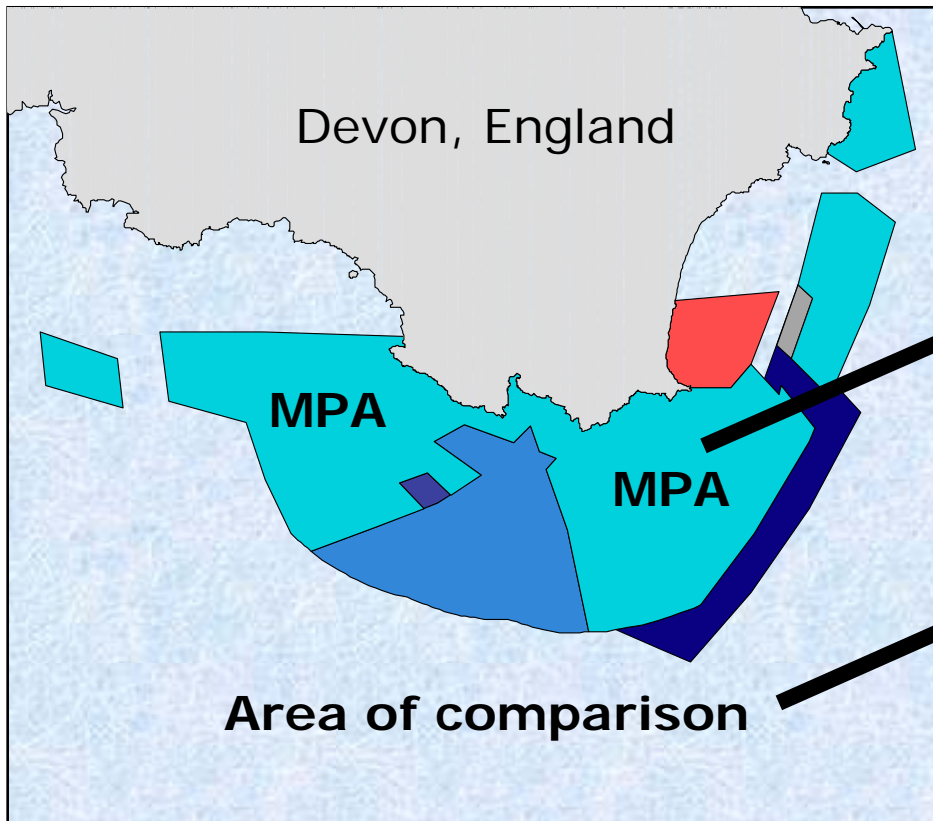

30 mpas are just enough to show big effects. To examine small effects (<0.2) such as the difference between mpas and controls for pelagic or benthopelagic fish >400 MPAs needed.

Critical knowledge gaps (among many)

- Soft sediment systems (no studies on sand alone or on mud)
- No information on spillover effects (one study explicitly examined change in effect with distance)
- Distinguishing confounding habitat effects from MPA effects difficult because of lack of BACI data

Confounding habitat effects

MPAs – a large-scale experiment

Multiple replicate sites

Representative

Resilience

**We should approach
management in an experimental
manner**

i.e. adaptive
